April 2, 1967

Mr. H. W. Treweek,
8th and Bush Streets,
Carlin, Nevada.

Dear Mr. Treweek:

It's about time I dropped you a line to thank you for the very pleasant and interesting interlude at Lynn Creek, about ten days ago. A number of things, mostly the unconsolidated material atop my desk, have kept me from doing many of the things I have wanted to do.

But, despite the silence, I did find the laboratory and the excellent company, a most rewarding few hours, and must thank you for your interest and hospitality.

Many of the things discussed helped me in my own thinking; but, primarily, to the extent that it pointed out to me how very little I know, how much there is to learn, and how complex this geological and mining business can be.

We do hope to get back into your neck of the woods in the future, and with your permission would plan to revisit, join you for a meal if you would consider joining me, see more of the property (and especially the Bootstrap) and explore that very interesting reasoning of yours: the catalytic effect of carbonaceous material. It is the same type of thinking we tried to use, years ago on a French Guiana problem; and even, many many years ago, for the precipitation of stream iron, in the Paramayo River of Bolivia, which drained from the Cerro Rico de Potosi, stanniferous in a low grade way.

Give my very best to your good wife, and please let us know when and if you are in Reno. We would like, so very much to see you.

Sincerely,

David LaCount Evans
