DEVELOPMENT: Cross-cut adit on exposed vein.

ACTIVITY AT TIME OF EXAMINATION: None

GEOLOGY: The workings consist of a cross-cut adit that explores a N25°E, 75°SW, 4-6 foot vein in rhyolite that can be traced on the surface for over three hundred feet. The vein consists of strings of vuggy limonite-stained quartz with minor brecciation. Sample 3839 contained only 7 ppm silver and .05 ppm gold but contained moderately anomalous molybdenum (40 ppm), similar to values in molybdenum values in nearby samples.
