Land N

The Land N Tungsten property consists of the Divide, Divide No. 1, Short Shot, and Medium Shot claims located about ten miles southeast of Gardnerville.

Limestone is the predominant rock in the area which has been cut by dikes of calcite that strike northwesterly. In a few places the limestones have been altered to tactite. Tungsten mineralization on the Divide claim occurs in a tactite zone eight to ten feet wide. From this zone about 800 tons of ore was mined that contained 500 units of  $WO_3$ . No new ore segments have been developed. Mining was stopped in 1955.
