

The Snowstorm property consists of 1 unpatented lode claim situated in PEG the low hills on the east flank to the Trinity Range, 6 miles southwest of Lovelock, the supply and shipping point.

Item 13

The claim was located by Wayne Stoker in December 1942 and optioned to Rare Metal, Inc.

The rocks exposed in the area consist of blocky hornfels that strike north to northwest and dip steeply northeast. On the south side of the area a small aplitic dike intrudes the hornfels that trends west to northwest. North of this dike, 6 pods of scheelite-bearing tactite occur in hornfels irregularly spaced in an area about 400 feet square. The tactite consists of a coarse garnet and epidote. No pod is wider than 6 inches, and several of them vary in width from 1 to 2 inches. The average length is about 10 feet.

Assay results of samples taken from the various pods varied from 0.1 to 3.9 percent WO<sub>3</sub>. No tungsten ore has been produced or shipped from the property.

in length and 4 feet in width.

Work on the property in 1953 was just getting started. Up to that time, 2 trucks of ore, possible 20 tons, were shipped to Toy for mill testing purposes.

The amount of ore eventually produced is not known.
