ITEM 7

On May 7 and 8, 1940, Taylor and Evans examined in detail the Quartz Mtn Area. With the help of an underground assay map provided by Mr. Perolaz (owner) of Reno, it appeared that better grade values were associated with local areas of intense fracturing. This observation, aided by the widespread sampling of the rhyolite, itself, nullifies the original hope of a large area carrying commercial values. Samples taken over the deposit assayed from trace to \$0.76 and were most discouraging.

D. L. EVANS
