OWNERSHAP: Rand claims = Amselco (staked by Lyell Campbell) RODUCTION: Unknown HISTORY: DEVELOPMENT: Partially cayed shaft ** 20-30' deep (?) with timbered frame around collar. ACTIVITY ATHMEOFEXAMINATION: None, other than staking in area but some old old flagging in area. GEOLOGY: Shaft is sunk in black to brown silty shales(pilot Fm?) fust W of a resistant ric of lasperoid breccia. The shales are oxidized (limonitic) on weathered surface & have calcite coatings. AM dendrits on partings. 20' E of shaft is red colored jasperoid breccia containing silicified clasts of grey limeatone. The jasperoid bedy strikes W.N-S and continues across small drainage. Month of shaft. Jasperoid was sampled from dump, as shales did not appear mineralized. Most of consisted of shale, with mitor amount of unsilicified gry limestone with calcite veinlet Small rounded siliceous concretions also found on dump. They probably weathered out of shales. Small prospect in limestone SE of shaft. Dumb- next time we get shale sample too: (Dissem. Au!).	350 0012	(329)
