DEVELOPMENT: Several small, hand-dug prospect pits.ACTIVITY AT TIME OF EXAMINATION: None.

GEOLOGY: Several prospect pits explore minor amounts of iron-stained chalcedony in cream-colored, poorly welded? tuffs. No cinnabar was observed, but the prospecting was probably for Hg. A north-trending, 10 cm vein of chalcedony was observed in one pit. It is near vertical. The patchy chalcedony in other pits may be stratiform or vein (it could not be determined).

There are several other areas of chalcedony or opalite in the rocks exposed along the road between this prospect and the Fox Mine. They are mostly unprospected (no pits, etc.).

REMARKS: No sample.No photo.
