DEVELOPMENT: Inclined shaft - 60° to the west ~50-60 ft. deep. Several other shallow cuts scattered around the immediate area.ACTIVITY AT TIME OF EXAMINATION: None. Fairly new claim posts.GEOLOGY: Looking at material on dump shaft must have encountered an intrusive. Its metamorphosed, medium-coarse grained & may have been a granodiorite? Dark gray limestone is also on dump & is the surficial rock in the area. Milky white quartz material also lying on dump. Appears that shaft hit intrusive fairly high up?REMARKS: Sample # 2425
