Henrietta Unpatented Lode Mining Claim (sometimes known as Henreeta)

Tarantula Mining Co. - owner
Edward R. Bacon, President
2101 Folsom St.
San Francisco, California

LOCATION

Kennedy Mining District, Pershing County, Nevada, about 30 miles south of Imlay.

GEOLOGY

A narrow vein varying from 18 inches to $4\frac{1}{2}$ feet in width following bedding planes in schist. Values in gold, silver, and lead occur in small lenses.

DEVELOPMENT

The Henrietta vein is developed by four adit tunnels. The upper two adits are partially filled with debris; some oxidized mineralization is exposed. Principal mine workings are in the next lower or Henrietta adit tunnel, from which some stoping on several small lenses has been done both above and below the sill floor by means of raises and winzes. A crosscut adit tunnel about 195 feet vertically below the Henrietta adit tunnel cut the projected vein, which had a width of about $2\frac{1}{2}$ feet at this point.

Ore reserves: Several very small lenticular ore bodies have been developed in the Henrietta tunnel and winzes. Lenses above the tunnel level, however, have been stoped to their margins. The principal showings are in two small lenses in the 3 winzes below the Henrietta tunnel sill floor. These lenses will probably produce some profitable ore, but the tonnage is conjectural.
