

White  
Pine

The Grand View property consists of 4 unpatented lode claims situated on the west slope and near the north end of the Snake Range, about 15 miles north of Sacramento Pass and 75 miles by road and trail east of Ely, the supply and shipping point on the Nevada Northern Railroad.

Item  
62

Rocks in the area consist of limestone which is underlain by schist and quartzite. The latter formations are equivalent to Picche shale and Prospect Mountain quartzite.

The only scheelite occurrence on the property is found in an open cut about 100 feet above the base of the limestone. The cut, driven into the hillside is about 15 feet long, 4 feet wide, and 3 feet deep. Scheelite mineralization is exposed for a width of 3 feet in the bottom of the cut. The ore, consisting of

171

coarse-grained scheelite in silicified limestone, borders a 6 inch streak of galena-bearing quartz and calcite. The ore follows no well-defined structure, so it cannot be projected much beyond the visible limits. Two samples of sorted high-grade ore taken by the owner contained 5.0 and 7.0 percent  $WO_3$ .

No ore has been produced or shipped from the property.
