DEVELOPMENT: East-west bench on the northside of a very steep cliff.ACTIVITY AT TIME OF EXAMINATION: None

GEOLOGY: The workings have exposed a pod of highly brecciated, strongly silicified, vuggy vein material that contains green-purple fluorspar. The vein is within a highly silicified crystal lithic breccia that forms bold outcrops as cliffs along the west side of the drainage. Sample 1770 was taken across the vein and assayed detectable Au.
