Item 42

NAME OF PROPERTY

Clack Quicksilver Mine

Peggy Hamilton Clack - owner

LOCATION

Rochester Mining District, Pershing County, Nevada, on the east slope of the Humboldt Range.

GEOLOGY

Limestone is the principal rock formation in the immediate vicinity. Thin basalt flows form a capping in places.

Cinnabar was mined from a pipe-like deposit occurring in a prominent E-W fault fissure in the limestone.

DESCRIPTION OF PROPERTY

Cinnabar was mined to a depth of 230 feet, measured on the dip (60°) through an adit driven 470 feet to tap the vein. The ore was processed in a 15 ton rotary furnace, and a half dozen retorts, all now in poor condition.

The known deposits are completely exhausted, although there is a fair chance that others may be found by intelligent exploration.
