Valley View

32

The Valley View property, two miles southwest of the Ruby Valley Post Office is situated on part of the old Hankins Ranch. Scheelite mineralization occurs in thin seams along a contact between marble and sills of granodiorite, and as disseminated crystals in the altered sills. A persistent contact seam, one to four inches wide and 75 feet long, is estimated to average five percent scheelite, mostly in coarse crystals. Another sill, one foot wide, mostly altered to chlorite, contains disseminated scheelite estimated to average one percent WO_3 for a length of 35 feet. No minable orebodies have been developed.
