DEVELOPMENT: One prospect pit about 6-10' deep.

ACTIVITY AT TIME OF EXAMINATION: None.

GEOLOGY: Host rock is a dark-grey basaltic andesite. At the prospect, flow "beds" dip  
N-NW & are cut by a set of N-striking, high-angle fractures. Copper minerals, mostly  
malachite, are deposited along the fractures & also along "flow" or joint surfaces. The  
andesite is slightly silicified near the fractures & in a few places, cut by opaline  
veinlets.

An interesting texture noted in these rocks is the filling of amygdules by  
malachite.
