

1 Acn. Blocking out PROPERTY
1960-1968!

Molybdenite Nevada
Hall Property at
Liberty Peak, Near
Tonopah

249
ITEM 38

4120 0038

Examined on May 3, 1940. Detailed Notes are to be found in Field Book #1. Conclusions are as follows:

The following characteristics are worth noting:

1- The association of Molybdenite mineralization with an acid porphyry.

2- The circular distribution of silica as suggested by the surface.

3- The apparent control of silica and sulphide along a contact between porphyry and schist.

4- The lack of molybdenum and copper at the surface with promising values at the 250 level.

5- Small amt. develop. on a large str.
