GEOLOGY: Site is single vertical shaft (I think it might be an old well, since it's the only workings in a drainage directly downslope from the original silver mines in the Tempiute Range, also there are several old foundations, maybe the site of an old base camp), approximately 30 feet deep sunk in fragment rich, bleached and altered ash flow tuff(?), greenish-yellow surface alteration (Uranium?, Zeolite?), tuff quartz rich, moderately consolidated. Tuff outcrops prominently along either side of drainage. Locally fractured little of no structure, massive. Very minor Fe-Mn oxides staining. Punky, pumice fragments, glassy fragments.

REMARKS: Sample Site 1461
